

DLPC2607

DLPS030E - DECEMBER 2013 - REVISED MARCH 2019

DLPC2607 Low-power DLP® Display Controller

1 Features

- Supports Reliable Operation of the 0.2-nHD, 0.24-VGA, and 0.3-WVGA DMDs
- Multi-Mode, 24-Bit Input Pixel Interfaces:
 - Supports Parallel or BT656 Bus Protocol
 - Supports Input Sizes from QVGA Through WVGA
 - Supports 1- to 60-Hz Frame Rates
 - Supports Pixel Clock up to 33.5 MHz
 - Supports Landscape and Portrait Orientations
 - Support 8-, 16-, 18-, and 24-Bit Bus Options
 - Supports 3 Input Color Bit-Depth Options:
 - RGB888, YCrCb888
 - RGB666, YCrCb666
 - RGB565, 4:2:2 YCrCb
- Pixel Data Processing:
 - Image Resizing (Scaling)
 - Frame Rate Conversion
 - Color Coordinate Adjustment
 - Automatic Gain Control
 - Programmable Degamma
 - Spatial-Temporal Multiplexing (Dithering)
 - Video Processing Support:
 - Color Space Conversion
 - 4:2:2 to 4:4:4 Chroma Interpolation
 - Field Scaled De-Interlacing
- Packaged in a 176-Pin, 0.4-mm Pitch, VFBGA
- External Memory Support:
 - 166-MHz Mobile DDR SDRAM
 - 33.3-MHz Serial Flash
- WVGA, VGA, and nHD DMD Display Support
 - DMD Bit-Plane Generation and Formatting
 - Programmable Bit-Plane Display Sequencer (Controls the LED Enables and DMD Loading)
 - 76.2-MHz Double Data Rate (DDR) DMD I/F
 - Pulse-Width Modulation (PWM) for Mirrors:
 - Auto DMD Parking at Power-Down
 - 24-Bit Bit-Depth on DMD
- System Control:
 - I²C Control of Device Configuration
 - Programmable Splash Screens
 - Programmable LED Current Control
 - DMD Power and Mirror Driver Control
 - DMD Horizontal and Vertical Display Image

- Flip
- Display Image Rotation
- Flash-Based Configuration Batch Files
- I/F Sleep Still Image Power Savings Mode
- Test Support:
 - Built-In Test Pattern Generation
 - JTAG With Boundary Scan Test Support

2 Applications

- Embedded Mobile Projection
 - Smartphone
 - Tablet
 - Camera
 - Laptop
- Mobile Accessories
- Wearable (Near-Eye) Displays
- Battery-Operated Projectors

3 Description

The DLPC2607 is a low power DLP™ digital controller for battery powered display applications. The controller supports reliable operation of 0.3-WVGA, 0.24-VGA and 0.2-nHD DMDs. The DLPC2607 controller provides a convenient, multifunctional interface between system electronics and the DMD, enabling small form factor and low power displays.

Device Information⁽¹⁾

| PART NUMBER | PACKAGE | BODY SIZE (NOM) | |
|-------------|-------------|-------------------|--|
| DLPC2607 | VFBGA (176) | 7.00 mm × 7.00 mm | |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (May 2017) to Revision E

Page

| • | Changed Changed title from "DLPC2607 DLP PICO Processor 2607 ASIC" to "DLPC2607 Low-power DLP® Display Controller" | 1 |
|---|--|------|
| • | Added ZVB Package Bottom View | |
| • | Changed to "Add external pullup or pulldown resistors as needed to these signals to avoid floating inputs" | 5 |
| • | Changed PAD1000 to DLPA1000 | 5 |
| • | Changed to "Establish this setting" | |
| • | Changed "low a minimum" to "low to a minimum" | |
| • | Changed "Should be pulled up to" to "Pull up to" | |
| • | Changed "Unused inputs should be pulled down" to "Pull unused inputs" | |
| • | Added DMD INTERFACE pin descriptions | 7 |
| • | Added SDRAM INTERFACE pin descriptions | |
| • | Changed "It should be connected" to "Connect". | |
| • | Changed globally "Should be left open or unconnected for typical use." to "Leave open or unconnected for typical use." | . 10 |
| • | Changed globally "An external pullup should not be applied to this pin" to "Do not apply an external pullup to this pin" | . 10 |
| • | Swapped all values under I _{OH} and I _{OL} | 14 |
| • | Changed "that should be applied" to "can safely be applied" | |
| • | Changed "that should be applied" to "can safely be applied" | . 14 |
| • | Changed "OHand OL" to VOH and VOL to clarify meaning | 14 |
| • | Changed "VCCIO =" to "VCCIO (V)" | . 14 |

| R | evision History (continued) | |
|----|--|------|
| • | Changed "In addition, the SPIDOUT trace should be" to "Make the SPIDOUT trace" | 37 |
| • | Changed "The SPIDIN should be split" to "Make the SPDIN" | |
| • | Changed "on their way back" to "on the return" | |
| • | Changed "They should then share" to "Make sure they share" | |
| • | Changed "Variation from these recommendations may also work, but should be confirmed with PCB signal integrity analysis or lab measurements" to "Make sure to confirm any variation from these recommendations with PCB signal integrity analysis or lab measurements" | l |
| • | Changed PCB Design table to itemized list | 38 |
| • | Changed "should take" to "takes" | 40 |
| • | Changed "should take" to "takes" | 40 |
| • | Changed "should" to "must" | 40 |
| • | Changed "The pair should also be terminated" to "Terminate the pair" | 41 |
| • | Changed "Specifically should be terminated" to "Terminate" | 41 |
| • | Changed "Specifically should be terminated" to "Terminate" | 41 |
| • | Changed "kept" to "maintained to a length of" | 41 |
| • | Changed "should" to "does" | 41 |
| • | Removed table 'Compatible SPI Serial Flash Devices' from <i>Serial Flash Interface</i> since listed devices are end of life Replaced with new suggested devices as well as Table 4 which lists minimum performance specifications to determine flash device compatibility | |
| • | Added MSL Peak Temp to Packaging Information | 45 |
| Cł | nanges from Revision B (January 2014) to Revision C | Page |
| • | Added ESD Ratings table, Thermal Information table, Feature Description section, Device Functional Modes, Application and Implementation section, Power Supply Recommendations section, Layout section, Device and Documentation Support section, and Mechanical, Packaging, and Orderable Information section | 1 |
| Cł | nanges from Revision A (December 2013) to Revision B | Page |
| • | Removed product preview banner | 1 |
| Cł | nanges from Original (December 2013) to Revision A | Page |
| • | Corrected columns for I _{OH} and I _{OL} in I/O Characteristics | 14 |
| • | Updated B38 I/O Type value for V _{OH} (min) in I/O Characteristics | |
| • | Added additional table notes to I/O Characteristics | |
| • | Added table note to Internal Pullup and Pulldown Characteristics | 14 |

|--|------------------|----------------|--------------|--------------|---|--|--|--|--|
| PIN | PIN I/O | | CLOCK SYSTEM | DESCRIPTION | | | | | |
| NAME NO. | | POWER TYPE | | CLOCK GIGIEW | DESCRIPTION | | | | |
| DEVICE INITIALIZATION AND REFERENCE CLOCK ⁽¹⁾ | | | | | | | | | |
| RESETZ J14 | | VCC18 | I1 | Async | DLPC2607 power-on reset. Self-configuration starts when a low-to-high transition is detected on this pin. All ASIC power and clocks must be stable before this reset is de-asserted (hysteresis buffer). Note that the following seven signals tri-state while RESET is asserted: DMD_PWR_EN, LEDDVR_ON, LED_SEL_0,LED_SEL_1, SPICLK, SPIDOUT, SPICSZO Add external pullup or pulldown resistors as needed to these signals to avoid floating inputs. | | | | |
| PLL_REFCLK_I | K15 | \/CC40 (files) | 14 | N/A | Reference clock crystal input. If an external oscillator is used in place of a crystal, then use this pin as the oscillator Input. | | | | |
| PLL_REFCLK_O | J15 | VCC18 (filter) | O14 | N/A | Reference clock crystal return. If an external oscillator is used in place of a crystal, then leave this pin unconnected (floating). | | | | |
| FLASH INTERFACE | E ⁽²⁾ | <u>,</u> | | | | | | | |
| SPICLK | A4 | | O24 | N/A | Clock for the external SPI device or devices | | | | |
| SPIDIN | B4 | | 12 | SPICLK | Serial data input from the external SPI device or devices | | | | |
| SPICSZ0 | A5 | VCC FLSH | O24 | SPICLK | Chip select 0 output for the external SPI flash device. Active low | | | | |
| SPICSZ1 | C6 | | O24 | SPICLK | Chip select 1 output for the external SPI DLPA1000 device. Active low | | | | |
| SPIDOUT | C5 | | O24 | SPICLK | Serial data output to the external SPI device or devices. This pin sends address and control information as well as data when programming | | | | |
| MAIN VIDEO DATA | AND CON | NTROL | | • | | | | | |
| PARK | B8 | VCC_ INTF | 13 | Async | DMD park control (active low) is set high to enable typical operation. Establish this setting prior to releasing RESET, or within 500 µs after releasing RESET. It should be set low to a minimum of 500 µs before any power is to be removed from the DLPC2607 (hysteresis buffer). | | | | |
| LED_ENABLE | A11 | VCC_ INTF | 13 | Async | LED enable (active high input). A logic low on this signal forces LEDDRV_ON low and LED_SEL(1:0) = b00. These signals are enabled 100 ms after LED_ENABLE transitions from low to high (hysteresis buffer). | | | | |
| DBIC_CSZ | B10 | VCC_ INTF | 13 | SCL | Unused/reserved: Pull up to VCC_INTF. | | | | |
| SCL | A10 | VCC_ INTF | B38 | N/A | l ² C clock (hysteresis buffer) bidirectional, open-drain signal. An external pullup is required. No l ² C activity is permitted for a minimum of 100 ms after PARK and RESET are set high. | | | | |
| SDA | C10 | VCC_INTF | B38 | SCL | l ² C data (hysteresis buffer) bidirectional, open-drain signal. An external pullup is required. | | | | |

⁽¹⁾ Each device connected to the serial peripheral interface (SPI) bus must be operated off VCC_FLSH

⁽²⁾ Each device connected to the SPI bus must be operated off VCC_FLSH

- Pixel clock capture edge is software programmable.

 Data mask is optional for parallel bus operation. If unused, pull to ground through a resistor.

 Pull unused inputs to ground through an external resistor.

 VSYNC, HSYNC, and data valid polarity is software programmable.

 PDATA(23:0) bus mapping is pixel format and source mode dependent.

| | | POWER TYPE | | CLOCK SYSTEM | DESCRIPTION | |
| DMD INTERFACE | | | | | | |
| DMD_D0 | M15 | | | DMD_DCLK | DMD Data Pins. DMD Data pins are double data rate (DDR) signals that are | |
| DMD_D1 | N14 | | | | clocked on both edges of DMD_DCLK. All 15 DMD data signals are use to interface to the WVGA and VGA DMDs; | |
| DMD_D2 | M14 | | | | however, only 12 of the 15 are used to interface to an nHD DMD. | |
| DMD_D3 | N15 | | | | The standard nHD interconnect is to utilize pins DMD_D(11:0). However, DMD D(14:3) must be used to interface to the nHD DMD when the I ² C | |
| DMD_D4 | P13 | | | | programmable option to reverse the bit-order of the DMD interface pins is | |
| DMD_D5 | P14 | | | | selected (DMD Bus Swap Control, I ² C: 0xA7). | |
| DMD_D6 | P15 | | | | | |
| DMD_D7 | R15 | | | | | |
| DMD_D8 | R12 | | | | | |
| DMD_D9 | N11 | | | | | |
| DMD_D10 | P11 | | | | | |
| DMD_D11 | R11 | | | | | |
| DMD_D12 | N10 | VCC48 | VCC18 O58 | | | |
| DMD_D13 | P10 | VCC18 | | | | |
| DMD_D14 | R10 | | | | | |
| DMD_DCLK | N13 | | | N/A | DMD Data Clock (DDR) | |
| DMD_LOADB | R13 | | | DMD_DCLK | DMD Data Load Signal (active low). This signal requires an external pullup to VCC18. | |
| DMD_SCTRL | R14 | | | DMD_DCLK | DMD Data Serial Control Signal | |
| DMD_TRC | P12 | | | DMD_DCLK | DMD Data Toggle Rate Control | |
| DMD_DAD_BUS | L13 | | | DMD_SAC_CLK | DMD DAD Bus Data | |
| DMD_DAD_STRB | K13 | | | DMD_SAC_CLK | DMD DAD Bus Strobe | |
| DMD_DAD_OEZ | M13 | | | Async | DMD Reset Driver Output Enable (active low). To properly park the DMD, this signal requires a 30-k Ω to 100-k Ω external pullup resistor connected to VCC18. | |
| DMD_SAC_BUS | L15 | | | DMD_SAC_CLK | DMD SAC Bus Data | |
| DMD_SAC_CLK | L14 | | | N/A | DMD SAC Bus Clock | |

|------------------|---------|--------------|---------|---------------|---|--|--------------------------|
| PIN | | 1/0 | | CLOCK SYSTEM | DESCRIPTION | | |
| NAME | NO. | POWER | TYPE | | | | |
| LED DRIVER INTER | RFACE | | | T | T | | |
| GPIO1_RPWM | N8 | | O14 | Async | General-purpose I/O 1 (output only). If the DLPA1000 is not used, then the output must be used as the red LED PWM signal used to control the LED current. (8) If the DLPA1000 is used, then this output can be used as a general purpose output controlled by the WPC processor. | | |
| GPIO2_GPWM | P9 | | O14 | Async | General-purpose I/O 2 (output only). If the output must be used as the green LED P current. (8) If the DLPA1000 is used, then general purpose output controlled by the | WM signal used to control the LED this output can be used as a | |
| GPIO3_BPWM | R8 | | O14 | Async | General-purpose I/O 3 (output only). If the output must be used as the blue LED PW current. (8) If the DLPA1000 is used, then general-purpose output controlled by the | /M signal used to control the LED this output can be used as a | |
| LED_SEL_0 | R6 | | O14 | Async | LED enable SELECT. Controlled by prog (hysteresis buffer). | rammable DMD sequence timing | |
| | | | | | LED_SEL(1:0) | Selected LED | |
| | | | | | 00 | None | |
| | | VCC18 | | | 01 | Red | |
| LED_SEL_1 | N6 | | 014 | Async | 10 | Green | |
| | . 10 | | 017 | Async | 11 | Blue | |
| | | | | | These outputs should be input directly to DLPA1000 is not used, then a decode cir selected LED enable. | | |
| LEDDRV_ON | P7 | | O14 | Async | LED driver enable. Active-high output control to external LED driver logic (master enable). It is driven high 100 ms after LED_ENABLE is driven high and driven low immediately when either LED_ENABLE or PARK is driven low. | | |
| DMD_PWR_EN | K14 | | O14 | | DMD power regulator enable (active high). This is an active-high output that should be used to control DMD V _{OFFSET} , V _{BIAS} , and V _{RESET} voltages. DMD_PWR_EN is driven high when the PARK input signal is set high. However, DMD_PWR_EN is held high for 500 µs after the PARK input signal is set low before it is driven low. TI recommends a weak external pulldown resistor to keep this signal at a known state during power-up reset. | | |
| WHITE POINT COR | RECTION | LIGHT SENSOR | R I/F | 1 | | | |
| CMP_OUT | A6 | | I1 | Async | Successive approximation ADC compara Assumes a successive approximation AD sensor or thermocouple or both feeding c and the other side of the comparator driv ASIC. If this function is not used, pull it do | OC is implemented with either a light one input of an external comparator en from the CMP_PWM pin of the | |
| CMP_PWM | В7 | VCC_ 18 | VCC_ 18 | O14 | Async | Successive approximation comparator pu Supplies a PWM signal to drive the succe Comparator used in light-to-voltage lights is not used, leave it unconnected. | essive approximation ADC |
| GPIO0_CMPPWR | P5 | | B14 | Async | Power control signal for the WPC light sensor and other analog circuits using the DLPC2607 ADC. Alternately, it provides general I/O to the WPC microprocessor internal to the DLPC2607 device leave it unconnected (hysteresis buffer). | | |
| HWTEST_EN | A9 | VCC _INTF | 13 | N/A | Manufacturing test enable signal. Connectypical operation. Includes weak internal parts. | | |
| JTAGTDI | P6 | | | JTAGTCK | JTAG, serial data in. Includes weak interrheld low, this input can be used as ICP/\ | | |
| JTAGTCK | N5 | | l1 | N/A | JTAG, serial data clock. Includes weak in | iternal pullup. | |
| JTAGTMS | N7 | VCC _18 | | JTAGTCK | JTAG, test mode select. Includes weak in | nternal pullup. | |
| JTAGTDO | R7 | | O14 | JTAGTCK | JTAG, serial data out | | |
| JTAGRSTZ | P8 | | I1 | ASYNC | JTAG, RESET (active low). Includes wea be tied to ground, through an external ≤1 | | |

⁽⁸⁾ The DLPA1000 is not available for initial DLPC2607 design applications. When the DLPA1000 is not used, all LED PWM signals are forced high when LEDDRV_ON = 0, software LED control is disabled, or the sequence stops.

(10) External pullup resistor must be 15 k Ω or less.

Submit Documentation Feedback

⁽⁹⁾ If operation does not call for an external pullup and there is no external logic that might overcome the weak internal pulldown resistor, then this I/O can be left open or unconnected for typical operation. If operation does not call for an external pullup, but there is external logic that might overcome the weak internal pulldown resistor, then TI recommends an external pulldown resistor to ensure a logic low.

Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature (unless otherwise noted) (1)

| | | MIN | MAX | UNIT | |
|------------------------|---|------|------|------|--|
| Voltage ⁽²⁾ | V_{DD10} | -0.5 | 1.32 | | |
| | VDD_PLL | -0.5 | 1.32 | | |
| | V _{CC18} | -0.5 | 2.75 | V | |
| | VCC_FLSH | -0.5 | 3.6 | V | |
| | V _{CC_INTF} | -0.5 | 3.6 | | |
| | V _I 1.8 V, 2.5 V, 3.3 V ⁽³⁾ | -0.5 | 3.6 | | |
| T_{J} | Operating junction temperature | -30 | 105 | °C | |
| T _A | Operating ambient temperature (4) (5) | -30 | 85 | °C | |
| T _{stg} | Storage temperature | -40 | 125 | °C | |

⁽¹⁾ Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

All voltage values are with respect to GND and are at the device not at the power supply.

Applies to external input and bidirectional buffers.

TI strongly recommends I/O simulations (using IBIS models) for operation near the extremes of the supported ambient operating temperature range to ensure that the PCB design provides acceptable signal integrity.

The operating ambient temperature range assumes zero forced air flow, a JEDEC JESD51 junction-to-ambient thermal resistance value at zero forced air flow ($R_{\theta,JA}$ at 0 m/s), a JEDEC JESD51 standard test card and environment, along with minimum and maximum estimated power dissipation across process, voltage, and temperature. Thermal conditions vary by application, which impacts R_{AIA}.

Thus, maximum operating ambient temperature varies by application. (a) $T_{A_min} = T_{J_min} - (P_{D_min} \times R_{\theta JA}) = -30^{\circ}C - (0.0 \text{ W} \times 64.96^{\circ}\text{C/W}) = -30^{\circ}\text{C}$ (b) $T_{A_min} = T_{J_min} - (P_{D_min} \times R_{\theta JA}) = 105^{\circ}\text{C} - (0.3 \text{ W} \times 64.96^{\circ}\text{C/W}) = 85^{\circ}\text{C}$

6.2 ESD Ratings

| | | | VALUE | UNIT |
|------------------|-------------------------|--|-------|------|
| \/ | Electrostatic | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾ | ±2000 | \/ |
| V _{(ES} | ^{D)} discharge | Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾ | ±500 | V |

JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| | | | MIN | NOM | MAX | UNIT |
|--|--|-------------------|-------|-------|----------------------------|------|
| VDD10 | 1-V supply voltage, core logic | | 0.95 | 1 | 1.05 | V |
| VDD_PLL | Analog voltage for PLL | | 0.95 | 1 | 1.05 | V |
| VCC18 | 1.8-V supply voltage (for all non-flash and host in | nterface signals) | 1.71 | 1.8 | 1.89 | V |
| | /CC_FLSH Configuration and control I/O supply voltage (variable) | 1.8-V LVCMOS | 1.71 | 1.8 | 1.89 | V |
| VCC_FLSH Configuration and control I/O supply voltage (variable) | 0 117 0 | 2.5-V LVCMOS | 2.375 | 2.5 | 2.625 | V |
| | 3.3-V LVCMOS | 3.135 | 3.3 | 3.465 | V | |
| | | 1.8-V LVCMOS | 1.71 | 1.8 | 1.89 | V |
| VCC_INTF | Pixel interface supply voltage (variable) | 2.5-V LVCMOS | 2.375 | 2.5 | 2.625 | V |
| | | 3.3-V LVCMOS | 3.135 | 3.3 | 3.465 | V |
| VI | Input voltage | | -0.3 | | VCCIO ⁽¹⁾ + 0.3 | V |
| Vo | Output voltage | | 0 | | VCCIO ⁽¹⁾ | V |
| t _{RAMP} | Power supply ramp time | | 10 | | | μs |

(1) VCCIO represents the actual supply voltage applied to the corresponding I/O.

JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Thermal Information

over operating free-air temperature range (unless otherwise noted)

| | THERMAL METRIC ⁽¹⁾ | DLPC2607 ZVB (NFBGA) 176 PINS | UNIT |
|-----------------|---|-------------------------------------|------|
| $R_{\theta JC}$ | Junction-to-case thermal resistance | 19.52 | °C/W |
| $R_{\theta JA}$ | Junction-to-air thermal resistance (with no forced airflow) | 64.96 | °C/W |

For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report (SPRA953).

6.5 Typical Current and Power Dissipation

| VDD_PLL | 1 | 2.8 | 2.8 | 2.8 | 2.8 |
| VDD10 | 1 | 30.6 | 30.6 | 29.3 | 29.3 |
| Total | | | 82.1 | | 72.6 |

⁽¹⁾ I/F sleep is a programmable parameter that can be set to save power in free-run, sequencer mode when displaying still images on the DMD. When I/F sleep is enabled, any images applied to the input bus to the DLPC2607 device are ignored.

⁽²⁾ Power for both I/F sleep mode disabled and I/F sleep mode enabled was measured while transferring a full 864 x 480 landscape image at periodic 30 frames per second. The image was a 12 x 6 color checkerboard.

³⁾ All measurements were taken on a TI internal reference design board at 25°C ambient.

⁽⁴⁾ VCC_FLSH power was 0 at the time of the measurement because flash accesses are limited when the ASIC is being configured.

6.6 I/O Characteristics

Voltage and current characteristics for each I/O type signal listed previously in the DLPC2607 table are summarized in I/O Characteristics. All inputs and outputs are LVCMOS. (1)

| I/O TYPE | DESCRIPTION | VCCIO (NOM) (V) | V _{IL} ⁽²⁾ (min) (V) | V _{IL} (MAX) (V) | V _{IH} (MIN) (V) | V _{IH} ⁽³⁾ (MAX) (V) | Ι _{ΙΝ} ⁽⁴⁾ (MAX) (μΑ) | V _{OH} ⁽⁵⁾ (MIN) (V) | V _{OL} ⁽⁶⁾ (MAX) (V) | I _{OH} ⁽⁷⁾ (MIN) (mA) | I _{OL} ⁽⁸⁾ (MIN) (mA) | ITS ⁽⁹⁾ (MAX) (μA) |

- Pin PLL_REFCLK_I is a crystal oscillator input pin and is not tested during VIH/VIL testing.
- VIL(min) is the absolute minimum voltage that can safely be applied to each corresponding pin.
- VOH(max) is the maximum voltage that can safely be applied to each corresponding pin.
- Input leakage current with no internal pullup or pulldown. VIN = 0 or VIN = VCCIO where VCCIO = I/O supply voltage
- $I_{OH} = -$ rated current
- I_{OL} = + rated current (6)
- $V_{OH} = VOH(max)$ $V_{OL} = VOL(max)$ (7)
- Tri-state output leakage current. $V_{IN} = 0$ or $V_{IN} = VCCIO$ where VCCIO = I/O supply voltage
- (10) O64, O74, and B64 buffers are tested to only 100 μA for IOH/IOL due to tester limitations.
- (11) The O74 mDDR differential clock (CK) output is simply a pair of single-ended drivers driven by a true and complementary signal.
- (12) B18 buffers are not tested for I_{IH}.

6.7 Internal Pullup and Pulldown Characteristics

The resistance depends on the supply voltage level applied to the I/O. (1) (2)

| | VCCIO (V) | MIN | MAX | UNIT |
|--------------------------|-----------|------|-------|------|
| | 3.3 | N/A | N/A | |
| Weak pullup resistance | 2.5 | 33 | 89 | kΩ |
| | 1.8 | 50.3 | 157.3 | |
| | 3.3 | 17.8 | 79.6 | |
| Weak pulldown resistance | 2.5 | 37 | 109 | kΩ |
| | 1.8 | 51.8 | 184.1 | |

- The description column of identifies whether the corresponding signal includes an internal pullup or pulldown resistor.
- Due to tester limitations, only the 1.8-V pullup resistors are measured and no pulldown resistors are measured.

6.8 Parallel I/F Frame Timing Requirements

| | | | MIN | MAX | UNIT |
|--------------------|--|----------------------|-----|-----|----------------------|
| t _{p_vsw} | Pulse duration – VSYNC_WE high | 50% reference points | 1 | | lines |
| t _{p_vbp} | Vertical back porch – Time from the leading edge of VSYNC_WE to the leading edge HSYNC_CS for the first active line. (1) | 50% reference points | 2 | | lines |
| t _{p_vfp} | Vertical front porch – Time from the leading edge of the HSYNC_CS following the last active line in a frame to the leading edge of VSYNC_WE. (1) | 50% reference points | 1 | | lines |
| t _{p_tvb} | Total vertical blanking – Time from the leading edge of HSYNC_CS following the last active line of one frame to the leading edge of HSYNC_CS for the first active line in the next frame. This is equal to the sum of Vertical back porch (t_{p_vbp}) + Vertical front porch (t_{p_vtp}) . | 50% reference points | 12 | | lines |
| t _{p_hsw} | Pulse duration – HSYNC_CS high | 50% reference points | 4 | 128 | PCLKs |
| t _{p_hbp} | Horizontal back porch – Time from rising edge of HSYNC_CS to rising edge of DATAEN_CMD. | 50% reference points | 4 | | PCLKs |
| t _{p_hfp} | Horizontal front porch – Time from falling edge of DATAEN_CMD to rising edge of HSYNC_CS. | 50% reference points | 8 | | PCLKs |
| t _{p_thh} | Total horizontal blanking – Sum of horizontal front and back porches | 50% reference points | | | ⁽²⁾ PCLKs |

The programmable parameter vertical sync line delay (I²C: 0x23) must be set such that:

The programmable parameter vertical sync line delay (I-C: 0x23) must be set such that: $6 - \text{Vertical front porch} \ (t_{\text{D_Nfp}})' \ (\text{min 0}) \le \text{Vertical sync line delay} \le \text{Vertical back porch} \ (t_{\text{D_Nfp}}) - 2 \ (\text{max 15}).$ The default value for vertical sync line delay is set to 5; thus, only a vertical back porch less than 7 requires potential action.

Total horizontal blanking is driven by the max line rate for a given source, which is a function of resolution and orientation. See *Parallel I/F Maximum Parallel Interface Horizontal Line Rate* for max line rate for each source and display combination. $t_{\text{D_1th}} = \text{Roundup [(1000 \times f_{\text{clock}})/LR]} - \text{APPL}$ where $f_{\text{clock}} = \text{Pixel clock}$ rate in MHz, LR = Line rate in kHz, and the number of active pixels per (horizontal) line is APPL. If $t_{\text{D_1th}}$ is calculated to be less than $t_{\text{D_1hb}} + t_{\text{D_1hb}}$, then the pixel clock rate is too low, or the line rate is too high, and one or both must be adjusted. must be adjusted.

6.9 Parallel I/F General Timing Requirements

| | | | MIN | MAX | UNIT |
|-----------------------|---|-----------------------------|-------|------|------|
| $f_{ m clock}$ | Clock frequency, PCLK | | 1 | 33.5 | MHz |
| t _{p_clkper} | Clock period, PCLK | 50% reference points | 29.85 | 1000 | ns |
| t _{p_clkjit} | Clock jitter, PCLK | $Maxf_{clock}$ | (1) | (1) | |
| t _{p_wh} | Pulse-duration low, PCLK | 50% reference points | 10 | | ns |
| t _{p_wl} | Pulse-duration high, PCLK | 50% reference points | 10 | | ns |
| t _{p_su} | Setup time – HSYNC_CS, DATEN_CMD, PDATA (23:0) valid before the active edge of PCLK (2) | 50% reference points | 3 | | ns |
| t _{p_h} | Hold time – HSYNC_CS, DATEN_CMD, PDATA (23:0) valid after the active edge of PCLK (2) | 50% reference points | 3 | | ns |
| t _t | Transition time – All signals | 20% to 80% reference points | 0.2 | 4 | ns |

Clock jitter (in ns) should be calculated using this formula: Jitter = (1 / f_{clock} - 28.35 ns). Setup and hold times must be met during clock jitter.

See Figure 2.

6.11 BT.656 I/F General Timing Requirements

The DLPC2607 ASIC input interface supports the industry standard BT.656 parallel video interface. See the appropriate ITU-R BT.656 specification for detailed interface timing requirements. Map the BT.656 data bits to the DLPC2607 PDATA bus as shown in Figure 3. (1)

| | | | MIN | MAX | UNIT |
|-----------------------|---|-----------------------------|-------|------|------|
| f_{clock} | Clock frequency, PCLK | | 1 | 33.5 | MHz |
| t _{p_clkper} | Clock period, PCLK | 50% reference points | 29.85 | 1000 | ns |
| t _{p_clkjit} | Clock jitter, PCLK ⁽²⁾ | Maximum f_{clock} | (2) | (2) | |
| t _{p_wh} | Pulse duration low, PCLK | 50% reference points | 10 | | ns |
| t _{p_wl} | Pulse duration high, PCLK | 50% reference points | 10 | | ns |
| t _{p_su} | Setup time – HSYNC, DATEN, PDATA(23:0) valid before the active edge of PCLK | 50% reference points | 3 | | ns |
| t _{p_h} | Hold time – HSYNC, DATEN, PDATA(23:0) valid after the active edge of PCLK | 50% reference points | 3 | | ns |
| t _t | Transition time – All signals | 20% to 80% reference points | 0.2 | 4 | ns |

⁽¹⁾ The BT.656 I/F accepts 8-bit per color, 4:2:2 YCb/Cr data encoded per the industry standard though PDATA(7:0) on the active edge of PCLK (that is, programmable) as shown in Figure 2.

6.12 100- to 120-Hz Operational Limitations

The table below assumes that a front-end device ahead of the DLPC2607 device converts all 3-D sources to the 3-D format defined previously and provides any needed left-eye or right-eye selection control directly to the 3-D glasses (that is, the DLPC2607 device does not control the glasses). The DLPC2607 device includes a double buffer frame memory, which causes the displayed image to be delayed one frame relative to its input. This requires left or right eye-frame shutter control to be inverted prior to being sent to the glasses.

| SOURCE | RESOLUTION (APPL x ALPF) | MIN FRAME RATE (Hz) | NOM FRAME RATE (Hz) | MAX FRAME RATE (Hz) | MIN TVB (tp_tvb) (LINES) | MAX LINE RATE (kHz) | MIN LINE RATE (kHz) | MIN CLOCK RATE (MHz) |
|--------|-----------------------------|---------------------------|---------------------------|---------------------------|--------------------------------|---------------------------|---------------------------|----------------------------|
| nHD | 640 × 360 | 99 | 100 | 101 | 12 | 48 | (1) | (2) |
| WQVGA | 427 × 240 | 99 | 100 | 101 | 12 | 32 | (1) | (2) |
| QVGA | 320 × 240 | 99 | 100 | 101 | 12 | 32 | (1) | (2) |
| nHD | 640 × 360 | 118.8 | 120 | 121.2 | 12 | 48 | (1) | (2) |
| WQVGA | 427 × 240 | 118.8 | 120 | 121.2 | 12 | 32 | (1) | (2) |
| QVGA | 320 × 240 | 118.8 | 120 | 121.2 | 12 | 32 | (1) | (2) |

⁽¹⁾ Use the following equation to determine the minimum line rate for a given application. The application cannot be supported if the calculated minimum line rate exceeds the maximum line rate defined elsewhere in this table;

Line_Rate_min (kHz) = Frame_Rate_max (Hz) × [ALPF + TVB] /1000

Where: TVB = Total vertical blanking (in lines)

ALPF = Active lines per frame

Frame_Rate_max = Max frame rate including all expected wander

(2) The following equation should be used to determine the minimum pixel clock rate for a given application. The application cannot be supported if the calculated minimum pixel clock rate exceeds the max pixel clock rate defined in *Parallel I/F General Timing Requirements*.

Pixel_Clock_min (MHz) = Line_Rate_max (kHz) x (APPL + 12) / 1000

Where: APPL = Active pixels per line

Line_Rate_max = Max line rate including all expected wander

Submit Documentation Feedback

⁽²⁾ Clock jitter should be calculated using this formula: Jitter = $(1 / f_{clock} - 28.35 \text{ ns})$. Setup and hold times must be met during clock jitter.

6.13 Flash Interface Timing Requirements

The DLPC2607 ASIC flash memory interface consists of a SPI flash serial interface at 33.3 MHz (nominal). (1) (2)

| | | | MIN | MAX | UNIT |
|-----------------------|--|-----------------------------|---------|--------|------|
| f_{clock} | Clock frequency, SPI_CLK ⁽³⁾ | | 33.3266 | 33.34 | MHz |
| t _{p_clkper} | Clock period, SPI_CLK | 50% reference points | 29.994 | 30.006 | ns |
| t _{p_wh} | Pulse duration low, SPI_CLK | 50% reference points | 10 | | ns |
| t _{p_wl} | Pulse duration high, SPI_CLK | 50% reference points | 10 | | ns |
| t _t | Transition time – all signals | 20% to 80% reference points | 0.2 | 4 | ns |
| t _{p_su} | Setup time – SPI_DIN valid before SPI_CLK falling edge | 50% reference points | 10 | | ns |
| t _{p_h} | Hold time – SPI_DIN valid after SPI_CLK falling edge | 50% reference points | 0 | | ns |
| t _{p_clqv} | SP_ICLK clock low to output valid time – SPIDOUT and SPI_CSZ | 50% reference points | | 1 | ns |
| t _{p_clqx} | SPI_CLK clock low output hold time – SPI_DOUT and SPI_CSZ | 50% reference points | -1 | | ns |

- (1) Standard SPI protocol is to transmit data on the falling edge of SPI_CLK and capture data on the rising edge. The DLPC2607 device does transmit data on the falling edge, but it captures data on the falling edge rather than the rising edge. This provides support for SPI devices with long clock-to-Q timing. The DLPC2607 device hold capture timing is set to facilitate reliable operation with standard external SPI protocol devices.
- (2) With the above output timing, the DLPC2607 device provides the external SPI device 14-ns input set-up and 14-ns input hold relative to the rising edge of SPI_CLK.
- (3) This range includes the 200 ppm of the external oscillator (but no jitter).

6.14 DMD Interface Timing Requirements

The DLPC2607 ASIC DMD interface consists of a 76.19-MHz (nominal) DDR output-only interface with LVCMOS signaling. (see ⁽¹⁾)

| | | | MIN | MAX | UNIT |
|-------------------------|---|-----------------------------|--------|--------|------|
| f_{clock} | Clock frequency, DMD_DCLK and DMD_SAC_CLK ⁽²⁾ | | 76.175 | 76.206 | MHz |
| t _{p_clkper} | Clock period, DMD_DCLK and DMD_SAC_CLK | 50% reference points | 13.122 | 13.128 | ns |
| t _{p_wh} | Pulse duration low, DMD_DCLK and DMD_SAC_CLK | 50% reference points | 6.2 | | ns |
| t _{p_wl} | Pulse duration high, DMD_DCLK and DMD_SAC_CLK | 50% reference points | 6.2 | | ns |
| t _t | Transition time – all signals | 20% to 80% reference points | 0.3 | 2 | ns |
| t _{p_su} | Output setup time – DMD_D(14:0), DMD_SCTRL, DMD_LOADB and DMD_TRC relative to both rising and falling edges of DMD_DCLK ⁽³⁾ (4) | 50% reference points | | 1.5 | ns |
| t _{p_h} | Output hold time – DMD_D(14:0), DMD_SCTRL,DMD_LOADB and DMD_TRC signals relative to both rising and falling edges of DMD_DCLK ⁽³⁾ (4) | 50% reference points | | 1.5 | ns |
| t _{p_d1_skew} | DMD data skew – DMD_D(14:0), DMD_SCTRL, DMD_LOADB, and DMD_TRC signals relative to each other ⁽⁵⁾ | 50% reference points | | 0.2 | ns |
| t _{p_clk_skew} | Clock skew – DMD_DCLK and DMD_SAC_CLK relative to each other | 50% reference points | | 0.2 | ns |
| t _{p_d2_skew} | DAD/SAC data skew - DMD_SAC_BUS, DMD_DRC_OEZ ⁽⁶⁾ , DMD_DRC_BUS, and DMD_DRC_STRB signals relative to DMD_SAC_CLK | 50% reference points | | 0.2 | ns |

- (1) Assumes a 30-Ω series termination for all DMD interface signals (except DAD_DMD_OEZ)
- 2) This range includes the 200 ppm of the external oscillator (but no jitter).
- (3) Assumes minimum DMD setup time = 1 ns and minimum DMD hold time = 1 ns
- (4) Output setup and hold numbers already account for controller clock jitter. Only routing skew and DMD setup/hold must be considered in system timing analysis.
- (5) Assumes DMD data routing skew = 0.1 ns max
- (6) DMD_DAD_OEZ requires a 30- to 100-kΩ external pullup resistor connected to VCC18 to achieve proper timing.

6.15 mDDR Memory Interface Timing Requirements

The DLPC2607 controller mDDR memory interface consists of a 16-bit wide, mDDR interface (that is, LVCMOS signaling) operated at 133.33 MHz (nominal). (see $^{(1)}$ $^{(2)}$ $^{(3)}$)

| | | MIN | MAX | UNIT |
|--------------------|---|-------|------|------|
| t _{CYCLE} | Cycle-time reference | 7500 | | ps |
| t _{CH} | CK high pulse width ⁽⁴⁾ | 2700 | | ps |
| t _{CL} | CK low pulse width ⁽⁴⁾ | 2700 | | ps |
| t _{DQSH} | DQS high pulse width ⁽⁴⁾ | 2700 | | ps |
| t _{DQSL} | DQS low pulse width ⁽⁴⁾ | 2700 | | ps |
| t _{WAC} | CK to address and control outputs active | -2870 | 2870 | ps |
| t _{QAC} | CK to DQS output active | | 200 | ps |
| t _{DAC} | DQS to DQ and DM output active | -1225 | 1225 | ps |
| t _{DQSRS} | Input (read) DQS and DQ skew ⁽⁵⁾ | | 1000 | ps |

- (1) This includes the 200 ppm of the external oscillator (but no jitter).
- (2) Output setup and hold numbers already account for controller clock jitter. Only routing skew and memory setup/hold must be considered in system timing analysis.
- (3) Assumes a 30- Ω series termination on all signal lines.
- (4) CK and DQS pulse duration specifications for the DLPC2607 assume it is interfacing to a 166-MHz mDDR device. Even though these memories are only operated at 133.33 MHz, according to memory vendors, the rated t_{CK} specification (that is 6 ns) can be applied to determine minimum CK and DQS pulse duration requirements to the memory.
- (5) Note that DQS must be within the t_{DQSRS} read data-skew window, but need not be centered.

7 Detailed Description

7.1 Overview

The DLPC2607 is the display controller for the 0.3-WVGA, 0.24-VGA and 0.2-nHD DMDs. Both the controller and the DMD must be used in conjunction with each other for reliable operation of the DMD. The DLPC2607 display controller provides interfaces and data/image processing functions that are optimized for small form factor and low power display applications. Applications include pico projectors, smart projectors, screen less display, interactive display, wearable displays and many more. In typical systems a separate applications processor is used to provide various multimedia functionality (such as video decoder, HDMI receiver, VGA, SD card, or USB I/F chip).

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Parallel Bus Interface

The parallel bus interface complies with standard graphics interface protocol, which includes a vertical sync signal (VSYNC_WE), horizontal sync signal (HSYNC_CS), optional data valid signal (DATAEN_CMD), a 24-bit data bus (PDATA), and a pixel clock (PCLK). The user can program the polarity of both syncs and the active edge of the clock. Figure 1 shows the relationship of these signals. The data valid signal (DATAEN_CMD) is optional in that the DLPC2607 device provides auto-framing parameters that can be programmed to define the data valid window based on pixel and line counting relative to the horizontal and vertical syncs.

Feature Description (continued)

In addition to these standard signals, an optional side-band signal (PDM_CVS_TE) is available, which allows the user to stop the periodic frame updates without losing the displayed image. When PDM_CVS_TE is active, it acts as a data mask and does not allow the source image to be propagated to the display. A programmable PDM polarity parameter determines if it is active high or active low. This parameter defaults to make PDM CVS TE active high. Therefore, if this function is not desired, tie it to a logic low on the PCB. PDM_CVS_TE is restricted to change only during vertical blanking. Note that VSYNC_WE must remain active at all times (in Lock-to-VSYNC mode) or the display sequencer stops and causes the LEDs to be shut off.

The parallel bus interface supports six data transfer formats:

- 16-bit RGB565
- 18-bit RGB666
- 18-bit 4:4:4 YCrCb666
- 24-bit RGB888
- 24-bit 4:4:4 YCrCb888
- 16-bit 4:2:2 YCrCb (standard sampling assumed to be Y0Cb0, Y1Cr0, Y2Cb2, Y3Cr2, Y4Cb4, Y5Cr4, ...)

Figure 9 shows the required PDATA(23:0) bus mapping for these six data transfer formats.

Parallel Bus Mode - 4:4:4 RGB and YCrCb Sources

Parallel Bus Mode - 16-bit YCrCb 4:2:2 Source

Figure 9. PDATA Bus - Parallel I/F Mode Bit Mapping

7.3.2 100- to 120-Hz 3-D Display Operation

Submit Documentation Feedback

The DLPC2607 device supports 100- to 120-Hz 3-D display operation, but is limited to a narrow set of configurations. 3-D operation is limited to:

0.2-nHD DMDs only

Feature Description (continued)

- nHD, WQVGA and QVGA source resolutions
- Parallel bus interface only (all pixel formats are supported)
- Landscape source and display orientation only
- Non-interlaced video-graphics only
- 100-Hz ±1% or 120-Hz ±1% source frame rates
- Unpacked, full resolution, frame sequential, 3-D format (that is each 100- or 120-Hz source frame contains a single, full resolution, eye frame separated by VSYNCs, where an eye frame contains image data for a single left or right eye; not both)
- Minimum line rates that satisfy the high frame rates

To support 3-D operation, run the DLPC2607 device in Lock-to-VSYNC mode with 1x frame rate multiplication (that is, no frame rate multiplication). Each DMD frame is displayed at the source frame rate in the order it is received.

Because of the high frame rate of the source, the source line rate must be much higher than typical, but still cannot exceed the rates defined in *Parallel I/F Maximum Parallel Interface Horizontal Line Rate*. The minimum line rate is limited by the maximum frame rate and minimum total vertical blanking (TVB). *100- to 120-Hz Operational Limitations* provides a summary of the line rate range assuming the minimum TVB.

7.4 Programming

7.4.1 Serial Flash Interface

The DLPC2607 device uses an external SPI serial flash memory device for configuration support. The minimum required size depends on the desired minimum number of sequences, CMT tables, and splash options while the maximum supported is 16 Mb. Table 1 provides the list of the configuration options.

Table 1. Serial Flash Support Features by Density⁽¹⁾

| | | QUANTITY OF FEATURES THAT CAN BE SUPPORTED | | | | | | |
|---|--------------------------------|--|---|--------------------------|---------------------|--------------------|--------------------------|--------------------------------|
| D | TARGET FLASH ENSITY (Mb) | OPTICAL TEST STANDAR SPLASH SPLASH SCREENS SCREENS | | SERIES DATA SECTOR | UNIT DATA SECTOR | ODM DATA SECTOR | DLP DISPLAY SEQUENCES | CMT TABLES PER SEQUENCE (3) |
| | 4 Mb | 0 | 1 | 1 | 1 | 1 | 16 | 7 |
| | 8 Mb | 0 | 3 | 1 | 1 | 1 | 16 | 7 |
| | 16 Mb | 1 | 4 | 1 | 1 | 1 | 16 | 7 |

- (1) All rows in this table have passed DVT at TI.
- (2) Assumes individual DLP display sequences are limited to 5 KB each
- An equal number of CMT tables are required for each sequence (CMT tables define the DeGamma Curve). The DLPC2607 device uses a single SPI, employing SPI mode 0 protocol, operating at a frequency of 33.3 MHz. It supports two independent SPI chip selects. However, the primary flash must be connected to SPI chip select 0 (SPICS0) because the auto-initialization routine is always executed from the device connected to this chip select. The auto-initialization routine executed from flash consists of the following:

 (a) The DLPC2607 device first uploads the size and location of the auto-initialization routine from address range 0x0000 through 0x0007 of the serial flash memory connected to SPICS0.
 - (b) The DLPC2607 device then uploads the actual auto-initialization routine to its ICP program memory from the serial flash memory connected to SPICS0.
 - (c) The DLPC2607 device then executes an auto-init routine, which includes uploading default control parameter values, uploading mailbox memory contents, turning on the sequence and LEDs, and then enabling the display.
 - (d) Upon completion of the auto-initialization routine, the DLPC2607 signals INIT DONE with GPIO4_INTF.

The DLPC2607 device supports any flash device that is compatible with these modes of operation. However, the DLPC2607 device does not support the Normal (slow) Read Opcode, and thus cannot automatically adapt protocol and clock rate based on the flash's electronic signature ID. The flash instead uses a fixed SPI clock and assumes certain attributes of the flash have been ensured by PCB design. The DLPC2607 device also assumes the flash supports address auto-incrementing for all read operations. Table 2 and Table 3 list the specific instruction OpCode and timing compatibility requirements for a DLPC2607 device compatible flash.

Table 2. SPI Flash Instruction OpCode and Timing Compatibility Requirements

| SPI FLASH COMMAND | OPCODE (hex) | ADDRESS BYTES | DUMMY BYTES | MIN CLOCK RATE |
|---------------------------|--------------|---------------|-------------|----------------|
| Fast READ (single output) | 0x0B | 3 | 1 | 33.3 MHz |
| All others | Can vary | Can vary | Can vary | 33.3 MHz |

Table 3. SPI Flash Key Timing Parameter Compatibility Requirements

| | MIN | MAX | UNIT |
|-------------------------------|-----|-----|------|
| Minimum chip select high time | | 300 | ns |
| Minimum output hold time | 0 | | ns |
| Maximum output valid time | | 9 | ns |
| Minimum data in setup time | | 5 | ns |
| Minimum data in hold time | | 5 | ns |

The DLPC2607 device does not have any specific page, block, or sector size requirements, except that programming with the I²C interface requires the use of page mode programming. However, if the user would like to use a portion of the serial flash for storing external data (such as calibration data) with the I²C interface, then the minimum sector size must be considered as it drives minimum erase size. Note that use of serial flash for storing external data may impact the number of features that can be supported.

NOTE

The DLPC2607 device does not drive the \overline{HOLD} (active low hold) or \overline{WP} (active low write protect) pins on the flash device. Tie these pins to a logic high on the PCB with an external pullup.

The DLPC2607 device supports 1.8 V, 2.5 V, or 3.3 V serial flash devices. Some suggested devices would include the W25Q16DWSSIG or MX25U4035. If a different flash device is used, Table 4 lists the minimum performance specifications necessary.

Table 4. Specifications of Compatible SPI Serial Flash Devices

| SPI Flash Timing Parameter | MIN | MAX |
|-------------------------------|---------|-------|
| Minimum Chip Select High Time | | 300ns |
| Minimum Output Hold Time | Ons | |
| Maximum Output Valid Time | | 9ns |
| Minimum Data in Setup Time | | 5ns |
| Minimum Data in Hold Time | | 5ns |
| Minimum Clock Rate | 33.3MHz | |

7.4.2 Serial Flash Programming

The flash can be programmed through the DLPC2607 device over I²C (for directions, see the *DLPC2607 Software Programmer's Guide*, DLPU013) or by driving the SPI pins of the flash directly while the DLPC2607 device I/O are tri-stated. SPICLK, SPIDOUT, and SPICZ0 I/O can be tri-stated by holding RESET in a logic-low state while power is applied. Note that SPICSZ1 is not tri-stated by this same action.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DLPC2607 controller supports reliable operation of .3-WVGA, .24-VGA and .2-nHD DMDs and must be always used with the DMD to provide a reliable display solution for various data and video display applications. The DMDs are spatial light modulators which reflect incoming light from an illumination source to one of two directions, with the primary direction being into a projection or collection optic. Each application is derived primarily from the optical architecture of the system and the format of the data coming into the DLPC2607. Applications of interest include accessory projectors, projectors embedded in display devices like notebooks, laptops, tablets, and set top box. Other applications include wearable (near-eye or head mounted) displays, interactive display and low latency gaming display.

8.2 Typical Application

Figure 10 shows a typical accessory projector application. For this application, the DLPC2607 device is controlled by a separate control processor (typically a MSP430) and the image data is received from a TVP5151 video decoder device. For this application, the ASIC supports periodic sources only. A common application when using DLPC2607 controller is for creating an accessory Pico projector for a smartphone, tablets or any other display source. The DLPC2607 in the accessory Pico projector typically receives images from a host processor or a multimedia processor.

Figure 10. Typical Standalone Projector System Block Diagram

8.2.1 System Functional Modes

The application system has two functional modes (ON/OFF) controlled by a single pin PROJ_ON:

When pin PROJ_ON is set high, the projector automatically powers up and an image is projected from the

Typical Application (continued)

DMD.

When pin PROJ_ON is set low, the projector automatically powers down to save power.

8.2.2 Design Requirements

8.2.2.1 Reference Clock

The device requires an external reference clock to feed its internal PLL. This reference may be supplied by a crystal or oscillator. For flexibility, the DLPC2607 device accepts either of two reference clock frequencies (see Table 5), but both must have a maximum frequency variation of 200 ppm (including aging, temperature, and trim component variation). When a crystal is used, the configuration requires several discrete components, as shown in Figure 11.

CL = Crystal load capacitance (Farads)
CL1 = 2 x (CL - Cstray_pll_refclk_i)
CL2 = 2 x (CL - Cstray_pll_refclk_o)

Where:

Cstray_pll_refclk_i = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin pll_refclk_i.
Cstray_pll_refclk_o = Sum of package and PCB stray capacitance at the crystal pin associated with the ASIC pin pll_refclk_o.

Figure 11. Recommended Crystal Oscillator Configuration

Table 5. Crystal Port Characteristics

| PARAMETER | NOM | UNIT |
|---------------------------------|-----|------|
| PLL_REFCLK_I TO GND capacitance | 4.5 | pF |
| PLL_REFCLK_O TO GND capacitance | 4.5 | pF |

Table 6. Recommended Crystal Configuration

| PARAMETER | RECOMMENDED | UNIT |
|--|------------------------------|-----------|
| Crystal circuit configuration | Parallel resonant | |
| Crystal type | Fundamental (first harmonic) | |
| Crystal nominal frequency (See TSTPT_6 in the Pin Functions table) | 16.667 or 8.333 | MHz |
| Crystal frequency tolerance (including accuracy, temperature, aging, and trim sensitivity) | ±200 | PPM |
| Crystal drive level | 100 max | μW |
| Crystal equivalent series resistance (ESR) | 80 max | Ω |
| Crystal load | 12 | pF |
| R _S drive resistor (nominal) | 100 | Ω |
| R _{FB} feedback resistor (nominal) | 1 | $M\Omega$ |

Table 6. Recommended Crystal Configuration (continued)

| PARAMETER | RECOMMENDED | UNIT |
|---|--|------|
| C _{L1} external crystal load capacitor | See Figure 11 | pF |
| C _{L2} external crystal load capacitor | See Figure 11 | pF |
| PCB layout | TI recommends a ground isolation ring around the crystal | |

If an external oscillator is used, then the oscillator output must drive the PLL_REFCLK_I pin on the DLPC2607 ASIC. Leave the PLL_REFCLK_O pins unconnected. An oscillator that provides a spread-spectrum clock reduces EMI.

NOTE

The DLPC2607 device accepts between 0% to -2% spreading (that is, down spreading only) with a modulation frequency between 20 kHz and 65 kHz and a triangular waveform.

Similar to the crystal option, the oscillator input frequency is limited to 16.667 or 8.333 MHz. To configure the DLPC2607 device to accept the 8.333-MHz reference clock option, an external pullup resistor to VCC18 must be applied to the TSTPT (6) pin. To configure the DLPC2607 device to accept the 16.667-MHz reference clock option, leave the TSTPT (6) pin unconnected.

It is assumed that the external crystal or oscillator stabilizes within 50 ms after stable power is applied.

8.2.2.2 mDDR DRAM Compatibility

The following are the basic SDRAM compatibility requirements for the DLPC2607 SDRAM:

- SDRAM memory type: mDDR
- Size: 128 Mb minimum
- Organization: N x 16-bits wide x 4 banks
- Speed grade t_{CK}: 6-ns max
- CAS latency (C_L), t_{RCD}, t_{RP} parameters (clocks): 3, 3, 3
- Burst length options to include: Burst of 4
- Refresh period (full device): ≥64 ms

The following mDDR DRAM devices are recommended for use with the DLPC2607 device:

Table 7. Compatible mDDR DRAM Device Options (1) (2)

| DVT ⁽³⁾ | VENDOR | PART NUMBER | SIZE (Mb) | ORGANIZATION | SPEED GRADE t _{CK} (4) (ns) | C _L , t _{RCD} , t _{RP} (Clocks) |
|--------------------|---------|----------------------|-----------|--------------|--------------------------------------|--|
| No | Elpida | EDK1216CFBJ-60-F (5) | 128 | 8 M × 16 | 6 | (3) |
| Yes | Elpida | EDD25163HBH-6ELS-F | 256 | 16 M × 16 | 6 | (3) |
| No | Samsung | K4X56163PL-FGC6 (6) | 256 | 16 M × 16 | 6 | (3) |
| Yes | Samsung | K4X56163PN-FGC6 | 256 | 16 M × 16 | 6 | (3) |
| Yes | Micron | MT46H16M16LFBF-6IT:H | 256 | 16 M × 16 | 6 | (3) |
| Yes | Hynix | H5MS2562JFR-J3M | 256 | 16 M × 16 | 6 | (3) |

- (1) The DLPC2607 device does not use partial array self-refresh or temperature-compensated self-refresh options.
- (2) These part numbers reflect Pb-free package.
- (3) All these SDRAM devices appear compatible with the DLPC2607 device, but only those marked with 'yes' in the DVT column have been validated on a TI internal reference design board. Those marked with 'no' can be used at the risk of the ODM.
- (4) A 6-ns speed grade corresponds to a 166-MHz mDDR device.
- (5) These devices are EOL and no replacement with the same footprint. Do not use these in new designs.
- (6) The manufacturer has issued an upcoming end of life notice on this device.

8.2.3 Detailed Design Procedure

For connecting together the DLPC2607 controller and the DMD, see the reference design schematic. Follow the layout guidelines to achieve a reliable projector. The DLP system requires an optical module or light engine. An optical OEM that specializes in designing optics for DLP projectors typically supplies the optical engine that has the LED packages and the DMD mounted to it.

8.2.3.1 Hot-Plug Usage

The DLPC2607 device provides fail-safe I/O on all host interface signals (signals powered by VCC_INTF). This protection allows the device to drive these inputs high even when no I/O power is applied.

Under this condition, the DLPC2607 device does not load the input signal, nor draw excessive current that could degrade ASIC reliability. For example, the I²C bus from the host to other components would not be affected by powering off VCC_INTF to the DLPC2607 device. Note that TI recommends weak pullups or pulldowns on signals feeding back to the host to avoid floating inputs.

8.2.3.2 Maximum Signal Transition Time

Unless otherwise noted, the maximum recommended 20% to 80% rise and fall time to avoid input buffer oscillation is 10 ns. This applies to all DLPC2607 device input signals.

NOTE

The PARK input signal includes an additional small digital filter that ignores any inputbuffer transitions caused by a slower rise and fall time for up to 150 ns.

8.2.3.3 Configuration Control

The primary configuration control mechanism for the DLPC2607 device is the I²C interface. See the *DLPC2607 Software Programmer's Guide*, DLPU004, for details on how to configure and control the DLPC2607.

8.2.3.4 White Point Correction Light Sensor

With the addition of a light-to-voltage light sensor (such as a phototransistor) and a voltage comparator circuit, the DLPC2607 device supports automatic white point correction and power control.

8.2.4 Application Curve

As the LED currents that are driven time-sequentially through the red, green, and blue LEDs are increased, the brightness of the projector increases. This increase is somewhat non-linear, and the curve for typical white screen lumens changes with LED currents is shown in Figure 12. For the LED currents shown, it is assumed that the same current amplitude is applied to the red, green, and blue LEDs.

Figure 12. Luminance vs Current

As with prior DLP electronics solutions, image data is 100% digital from the DLPC2607 device input port to the image projected on to the display screen. The image stays in digital form and is never converted into an analog signal. The DLPC2607 device processes the digital input image and converts the data into bit-plane format as needed by the DMD. The DMD then reflects light to the screen using binary pulse-width modulation (PWM) for each pixel mirror. The viewer's eyes integrate this light to form brilliant, crisp images.

9 Power Supply Recommendations

9.1 System Power Considerations

Table 8 provides a summary of the required power delivery requirements for DLPC2607 for various VCC_FLSH and VCC_INTF power options.

Table 8. Configuration Based Power Supply Requirements

| ASIC POWER RAIL | USAGE | NOMINAL VOLTAGE (V) | TOTAL SUPPLY MARGIN ⁽¹⁾ |
|-----------------|---------------------|------------------------|---------------------------------------|
| VCC_INTF (2) | Video interface I/O | 1.8, 2.5, or 3.3 | ±5% |
| VCC_FLSH (3) | Flash I/O | 1.8, 2.5, or 3.3 | ±5% |
| VDD_PLL (4) | Internal PLL | 1 | ±5% |
| VCC18 | mDDR and DMD I/O | 1.8 | ±5% |
| VDD10 | ASIC core | 1 | ±5% |

- (1) Total supply margin = DC offset budget + AC noise budget
- (2) VCC_INTF is independent of all other supplies.
- (3) VCC_FLSH is independent of all other supplies.
- (4) When possible, TI recommends to use a tighter supply tolerance (±3%) for the power to the PLL in order to improve system noise immunity.

9.2 System Power-Up and Power-Down Sequence

Although the DLPC2607 device requires an array of power supply voltages, (that is, VDD, VDD_PLL, VCC_18, VCC_FLSH, and VCC_INTF), there are no restrictions regarding the relative order of power supply sequencing to avoid damaging the DLPC2607 device. This is true for both power-up and power-down scenarios. Similarly there is no minimum time between powering-up or powering-down the different supplies feeding the DLPC2607 device.

NOTE

Often, there are power sequencing requirements for devices that share the supplies with the DLPC2607 device.

From a functional standpoint, there is one specific power-sequencing recommendation to ensure proper operation. In particular, apply all ASIC power and allow it to reach the minimum specified voltage levels before RESET is deasserted to ensure proper power-up initialization is performed. Ensure that all I/O power remains applied as long as 1-V core power is applied and RESET is de-asserted.

NOTE

When VDD10 core power is applied but I/O power is not applied, additional leakage current may be drawn.

System Power-Up and Power-Down Sequence (continued)

Figure 13. Power-Up and Power-Down Timing

9.3 System Power I/O State Considerations

Note that:

- If VCC18 I/O power is applied when VDD10 core power is not applied, then all mDDR (non-fail-safe) and non-mDDR (fail-safe) output signals associated with the VCC18 supply are in a high-impedance state.
- If VCC_INTF or VCC_FLSH I/O power is applied when VDD10 core power is not applied, then all output signals associated with these inactive I/O supplies are in a high-impedance state.
- If VDD10 core power is applied but VCC_INTF or VCC_FLSH I/O power is not applied, then all output signals associated with these inactive I/O supplies are in a high-impedance state.
- If VDD10 core power is applied but VCC18 I/O power is not applied, then all mDDR (non-fail-safe) and non-mDDR (fail-safe) output signals associated with the VCC18 I/O supply are in a high-impedance state. However, if driven high externally, only the non-mDDR (fail-safe) output signals remain in a high-impedance state, and the mDDR (non fail-safe) signals are shorted to ground through clamping diodes.

9.4 Power-Up Initialization Sequence

It is assumed that an external power monitor holds the DLPC2607 device in system reset during power-up. It must do this by driving RESET to a logic low state. It should continue to assert system reset until all ASIC voltages have reached minimum specified voltage levels, PARK is asserted high, and input clocks are stable. During this time, most ASIC outputs are driven to an inactive state and all bidirectional signals are configured as inputs to avoid contention. ASIC outputs that are not driven to an inactive state are tri-stated, which includes DMD_PWR_EN, LEDDVR_ON, LED_SEL_0, LED_SEL_1, SPICLK, SPIDOUT, and SPICSZO. After power is stable and the PLL_REFCLK clock input to the DLPC2607 device is stable, then RESET should be deactivated (set to a logic high). The DLPC2607 device then performs a power-up initialization routine that first locks its PLL, followed by loading self configuration data from the external flash. Upon release of RESET, all DLPC2607 device I/Os become active. Immediately following the release of RESET, the GPIO4_INTF signal is driven high to indicate that the auto-initialization routine is in progress. Upon completion of the auto-initialization routine, the DLPC2607 device drives GPIO4_INTF low to signal INITIALIZATION DONE (also known as INIT DONE).

NOTE

The host processor can start sending standard I²C commands after GPIO4 (INIT_DONE) goes low, or a 100-ms timer expires in the host processor, whichever is earlier, irrespective of whether the motor is enabled or not. However, before sending any compound I²C commands at power-up, the host processor must wait until GPIO4 (INIT_DONE) goes low, irrespective of whether the motor control function is enabled or not. Due to motor movement, the worst-case time to wait for GPIO4 to go low is when the motor control function is enabled and system dependent; it may take several seconds.

Power-Up Initialization Sequence (continued)

Figure 14. Initialization Timeline

9.5 Power-Good (PARK) Support

The PARK signal operates as an early warning signal that alerts the controller 500 µs before DC supply voltages have dropped below specifications. This allows the controller time to park the DMD, ensuring the integrity of future operation. The reference clock continues to run. RESET remains deactivated for at least 500 µs after PARK has been deactivated (set to a logic low) to allow the park operation to complete.

10 Layout

10.1 Layout Guidelines

10.1.1 Internal ASIC PLL Power

TI recommends the following guidelines to achieve desired ASIC performance relative to the internal PLL. The DLPC2607 device contains one internal PLL, which has a dedicated analog supply (VDD_PLL and VSS_PLL). Isolate VDD_PLL power and VSS_PLL ground pins using an RC-filter consisting of two 50- Ω series ferrites and two shunt capacitors (to widen the spectrum of noise absorption). TI recommends one 0.1- μ F capacitor and that the other is a 0.01- μ F capacitor. Place all four components as close to the ASIC as possible; it is especially important to keep the leads of the high-frequency capacitors as short as possible. Note that the user should connect both capacitors across VDD_PLL and VSS_PLL on the ASIC side of the ferrites.

The PCB layout is critical to PLL performance. The ground and power domains are analog signals, and should be treated as such to achieve minimum noise. Therefore, VDD_PLL must be a single trace from the DLPC2607 device to both capacitors, and then through the series ferrites to the power source. Ensure that the power and ground traces are as short as possible, parallel to each other, and as close as possible to each other.

Figure 15. PLL Filter Layout

Layout Guidelines (continued)

10.1.2 General Handling Guidelines for Unused CMOS-Type Pins

To avoid potentially damaging current caused by floating CMOS input-only pins, TI recommends to tie unused ASIC input pins through a pullup resistor to their associated power supply or a pulldown to ground. For ASIC inputs with internal pullup or pulldown resistors, it is unnecessary to add an external pullup or pulldown unless specifically recommended.

NOTE

Internal pullup and pulldown resistors are weak so do not expect them to drive the external line. The DLPC2607 device implements very few internal resistors and these are noted in the pin list.

Never tie unused output-only pins directly to power or ground. These pins can be left open.

When possible, TI recommends that unused bidirectional I/O pins be configured to their output state such that the pin can be left open. If this control is not available and the pins may become an input, then ensure they are pulled-up (or pulled-down) using an appropriate, dedicated resistor.

10.1.3 SPI Signal Routing

The DLPC2607 device is designed to support two SPI slave devices, specifically, a serial flash and the PMD1000. Given this requires routing associated SPI signals to two locations while attempting to operate at 33.3 MHz, ensure that reflections do not compromise signal integrity. TI recommends the following:

- Split the SPICLK PCB signal trace from the DLPC2607 source to each slave device into separate routes as close to the DLPC2607 device as possible. Make the SPICLK trace length to each device equal in total length.
- Split the SPIDOUT PCB signal trace from the DLPC2607 source to each slave device into separate routes as close to the DLPC2607 device as possible. Make the SPIDOUT trace length to each device equal in total length (that is, use the same strategy as SPICLK).
- Make the SPIDIN PCB signal trace from each slave device to the point where they intersect on the return to the DLPC2607 device equal in length and as short as possible. Make sure they share a common trace back to the DLPC2607 device.
- SPICSZ0 and SPICSZ1 do not require special treatment because they are dedicated signals which drive only
 one device.

10.1.4 mDDR Memory and DMD Interface Considerations

High-speed interface waveform quality and timing on the DLPC2607 ASIC (that is, the mDDR memory I/F and the DMD interface) depend on the total length of the interconnect system, the spacing between traces, the characteristic impedance, etch losses, and how well matched the lengths are across the interface. Thus, ensuring positive timing margin requires attention to many factors.

As an example, the DMD interface system timing margin can be calculated as follows:

Setup margin = (DLPC2607 output setup) – (DMD input setup) – (PCB routing mismatch) – (PCB SI degradation) (1) Hold-time margin = (DLPC2607 output hold) – (DMD input hold) – (PCB routing mismatch) – (PCB SI degradation) where

 PCB SI degradation is signal integrity degradation due to PCB effects. This includes things such as simultaneously switching output (SSO) noise, crosstalk, and inter-symbol interference (ISI) noise.

The DLPC2607 device I/O timing parameters, as well as mDDR and DMD I/O timing parameters, can be found in their corresponding data sheets. Similarly, PCB routing mismatch can be easily budgeted and met by controlled PCB routing. However, PCB SI degradation is not so straight forward.

In an attempt to minimize the signal integrity analysis that would otherwise be required, the following PCB design guidelines are provided as a reference of an interconnect system that satisfies both waveform quality and timing requirements (accounting for both PCB routing mismatch and PCB SI degradation). Make sure to confirm any variation from these recommendations with PCB signal integrity analysis or lab measurements.

Layout Guidelines (continued)

10.1.5 PCB Design

- · Configuration: Asymmetric dual stripline
- Etch thickness (T): 0.5 oz copper
- Single-ended signal impedance: 50 Ω (±10%)
- Single-ended signal impedance: 100-Ω differential (±10%)
- Reference plane 1 is assumed to be a ground plane for proper return path.
- Reference plane 2 is assumed to be the I/O power plane or ground.
- Dielectric FR4, (Er): 4.2 (nominal)
- Signal trace distance to reference plane 1 (H1): 5 mil (nominal)
- Signal trace distance to reference plane 2 (H2): 34.2 mil (nominal)

Figure 16. PCB Stacking Geometries

Layout Guidelines (continued)

10.1.6 General PCB Routing (Applies to All Corresponding PCB Signals)

Table 9. PCB Line and Spacing Recommendations (1) (2) (3)

| PARAMETER | APPLICATION | SINGLE-ENDED SIGNALS | DIFFERENTIAL PAIRS | UNIT | | | |
|--|--|-------------------------|---------------------|-------------|--|--|--|
| | Escape routing in ball field | 3 (0.762) | 3 (0.762) | mil (mm) | | | |
| Line width (M) | PCB etch – Outer layer data or control | 7.25 (0.184) | 4.5 (0.114) | mil (mm) | | | |
| Line width (W) | PCB etch - Inner layer data or control | 4.5 (0.114) | 4.5 (0.114) | mil (mm) | | | |
| | PCB etch clocks | 4.5 (0.114) | 4.5 (0.114) | mil (mm) | | | |
| | PCB etch data or control | N/A | 7.75 [1] (0.305) | mil (mm) | | | |
| Differential signal pair spacing (S) | PCB etch clocks | N/A | 7.75 [1] (0.305) | mil (mm) | | | |
| | Escape routing in ball field | 3 (0.762) | 3 (0.762) | mil (mm) | | | |
| Minimum line spacing to other signals | PCB etch – Outer layer data or control | 7.25 (0.184) | 4.5 (0.114) | mil (mm) | | | |
| (S) | PCB etch - Inner layer data or control | 4.5 (0.114) | 4.5 (0.114) | mil (mm) | | | |
| | PCB etch clocks | 11 (0.279) | 11 (0.279) | mil (mm) | | | |
| Maximum differential pair P-to-N length mismatch | Total clock | N/A | 25 (0.635) | mil (mm) | | | |

- (1) Spacing may vary to maintain differential impedance requirements.
- (2) The DLPC2607 device only includes one differential signal pair MEM0_CK_P and MEM0_CK_N.

These PCB design guidelines are purposefully conservative to minimize potential signal integrity issues. Given this device is targeted for low-cost, handheld application, there is a need to be more aggressive with these best practices. TI highly recommends to perform a full-board-level signal integrity analysis, if these guidelines cannot be followed. The DLPC2607 IBIS models are available for such analysis.

10.1.7 Maximum, Pin-to-Pin, PCB Interconnects Etch Lengths

Table 10. Max Pin-to-Pin PCB Interconnect Recommendations (1) (2)

| | SIGNAL INTERCONNECT TOPOLOGY | | | |
|--|---------------------------------------|--------------------------------------|--------------|--|
| BUS | SINGLE BOARD SIGNAL ROUTING LENGTH | MULTI-BOARD SIGNAL ROUTING LENGTH | UNIT | |
| DMD | | | | |
| DMD_D(14:0), DMD_DCLK, DMD_TRC, DMD_SCTRL, DMD_LOADB, DMD_OEZ DMD_DAD_STRB, DMD_DAD_BUS, DMD_SAC_CLK and DMD_SAC_BUS | 4 max (101.5 max) | 3.5 max (88.91 max) | inch (mm) | |
| mDDR | | | | |
| MEM0_DQ(15:8), MEM0_UDM and MEM0_UDQS | 1.5 max 38.1 max | NA | inch (mm) | |
| mDDR | | | | |
| MEM0_DQ(7:0), MEM0_LDM and MEM0_LDQS | 1.5 max (38.1 max) | NA | inch (mm) | |
| mDDR | | | | |

⁽¹⁾ Max signal routing length includes escape routing.

⁽³⁾ These values are merely recommendations to achieve good signal integrity. The OEM is free to apply their own rules as long as they maintain good signal integrity.

⁽²⁾ Multi-board DMD routing length is more restricted due to the impact of the connector.

Table 10. Max Pin-to-Pin PCB Interconnect Recommendations⁽⁾ (continued)

| | SIGNAL INTERCONNECT TOPOLOGY | | | |
|---|---------------------------------------|--------------------------------------|--------------|--|
| BUS | SINGLE BOARD SIGNAL ROUTING LENGTH | MULTI-BOARD SIGNAL ROUTING LENGTH | UNIT | |
| MEM0_CK_P, MEM0_CK_N, MEM0_A(12:0), MEM0_BA(1:0), MEM0_CKE, MEM0_CSZ, MEM0_RASZ, MEM0_CASZ and MEM0_WEZ | 2.5 max (63.5 max) | N/A | inch (mm) | |

10.1.8 I/F Specific PCB Routing

Table 11. High-Speed PCB Signal Routing Matching Requirements⁽¹⁾ (2) (3)

| SIGNAL INTERCONNECT TOPOLOGY | | | | | | | |
|------------------------------|--|---------------------------|------------------|-------------|--|--|--|
| IF | SINGLE GROUP | REFERENCE SIGNAL | MAX MISMATCH | UNIT | | | |
| DMD | DMD_D(14:0), DMD_TRC, DMD_SCTRL, DMD_LOADB, DMD_OEZ | DMD_DCLK | ±500 (±12.7) | mil (mm) | | | |
| | DMD_DAD_STRB, DMD_DAD_BUS | DMD_DCLK | ±750 (±19.05) | mil (mm) | | | |
| | DMD_SAC_BUS | DMD_SAC_CLK | ±750 (±19.05) | mil (mm) | | | |
| | DMD_SAC_CLK | DMD_DCLK | ±500 (±12.7) | mil (mm) | | | |
| | MEM0_CLK_P | MEM0_CLK_N | ±150 (±3.81) | mil (mm) | | | |
| mDDR: | Read/ Write Data Lower Byte: MEM0_LDM and MEM0_DQ(7:0) 38.1 max | MEM0_LDQS | ±300 (±7.62) | mil (mm) | | | |
| | Read/ Write Data Upper Byte: MEM0_UDM and MEM0_DQ(15:8) | MEM0_UDQS | ±300 (±7.62) | mil (mm) | | | |
| | Address and control: MEM0_A(12:0), MEM0_BA(1:0), MEM0_RASZ , MEM0_CASZ, MEM0_WEZ, MEM0_CSZ, MEM0_CKE | MEMO_CLK_P/ MEMO_CLK_N | ±1000 (±25.4) | mil (mm) | | | |
| | Data strobes: MEM0_LDQS and MEM0_UDQS | MEM0_CLK_P/ MEM0_CLK_N | ±300 (±7.62) | mil (mm) | | | |

⁽¹⁾ These values apply to PCB routing only. They do not include any internal package routing mismatch associated with the DLPC2607 device, DMD, or mDDR memory.

10.1.9 Number of Layer Changes

- Single-ended signals: Minimize the number of layer changes.
- Differential signals: Individual differential pairs can be routed on different layers, but the signals of a given pair must not change layers.

10.1.10 Stubs

Avoid stubs.

Product Folder Links: DLPC2607

Copyright © 2013-2019, Texas Instruments Incorporated

⁽²⁾ DMD data and control lines are DDR, whereas DMD_SAC and DMD_DAD lines are single data rate. Matching the DDR lines is more critical and takes precedence over matching single data rate lines.

⁽³⁾ mDDR data, mask, and strobe lines are DDR, whereas address and control are single data rate. Matching the DDR lines is more critical and takes precedence over matching single data rate lines.

10.1.11 Termination Requirements:

DMD I/F Terminate all DMD I/F signals, with the exception of DMD_OEZ (specifically

DMD_D(14:0), DMD_DCLK, DMD_TRC, DMD_SCTRL, DMD_LOADB,

DMD_DAD_STRB, DMD_DAD_BUS, DMD_SAC_CLK, and DMD_SAC_BUS), at the source with a 10- to $30-\Omega$ series resistor. TI recommends a $30-\Omega$ series resistor for most applications because this minimizes overshoot, undershoot, and reduces EMI; however, for systems that must operate below -20° C, it may be necessary to reduce this series resistance to avoid narrowing the data eye too much under worse-case PVT conditions.

TI recommends IBIS simulations for this worse-case scenario.

mDDR memory I/F

mDDR differential

clock

Terminate each line, specifically MEM0_CK(P:N), at the source with a $30-\Omega$ series resistor. Terminate the pair with an external $100-\Omega$ differential termination across the two signals as close to the DRAM as possible. (It may be possible to use a $200-\Omega$ differential termination at the DRAM to save power while still providing sufficient signal integrity, but

this has not been validated.)

mDDR data, strobe,

and mask

Terminate MEM0_DQ(15:0), MEM0_LDM, MEM0_UDM, MEM0_LDQS, and MEM0_UDQS with a 30-Ω series resistor located midway between the two devices.

mDDR address and

control

Terminate MEM0_A(12:0), MEM0_BA(1:0), MEM0_CKE, MEM0_CSZ, MEM0_RASZ,

MEM0 CASZ, and MEM0 WEZ at the source with a 30- Ω series resistor.

For applications where the routed distance of the mDDR or DMD signal can be maintained to a length of less than 0.75 inches, this signal is short enough not be considered a transmission line and does not need a series terminating resistor.

11 Device and Documentation Support

11.1 Device Support

11.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

11.1.2 Device Nomenclature

11.1.2.1 Device Marking

Marking definitions:

1. DLP device name

SC: Solder ball composition

e1: Indicates lead-free solder balls consisting of SnAgCu

G8: Indicates lead-free solder balls consisting of tin-silver-copper (SnAgCu) with silver content ≤1.5% and that the mold compound meets TI's definition of green

2. TI part number

AB (1 or 2 alphanumeric) = '**A**' corresponds to the TI device dash number. '**B**' is reserved for an unqualified device marking. All unqualified devices, including prototypes and skew lot samples, are labeled with the letter '**X**' in the '**B**' marking location (following the TI part number). '**B**' is left blank for qualified devices.

3. LLLLLLLLZZ Foundry lot code for semiconductor wafers and lead-free solder ball marking

LLLLLLL: Manufacturing lot code

ZZ: Lot split number

4. SSSSYYWWQQ: Package and assembly information

SSSS: Manufacturing site

YYWW: Date code (YY = Year :: WW = Week)

QQ: Qualification level option – engineering samples are marked in this field with an ES suffix.

For example, KOREA0914ES are engineering samples built in Korea the 14th week of 2009.

11.2 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

11.3 Trademarks

DLP, E2E are trademarks of Texas Instruments.

All other trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

11.5 Glossary

SLYZ022 — TI Glossary.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

www.ti.com

12.1 Package Option Addendum

12.1.1 Packaging Information

| Orderable Device | Status (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan (2) | Lead/Ball Finish | MSL Peak Temp (3) | Op Temp (°C) | Device Marking ⁽⁴⁾⁽⁵⁾ |
|------------------|------------|-----------------|--------------------|------|----------------|--------------|------------------|----------------------|-----------------|----------------------------------|
| DLPC2607ZVB | ACTIVE | NFBGA | ZVB | 176 | 260 | TBD | Call TI | Level-3-260C-168 HRS | -30 to 85 | |

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PRE_PROD Unannounced device, not in production, not available for mass market, nor on the web, samples not available.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

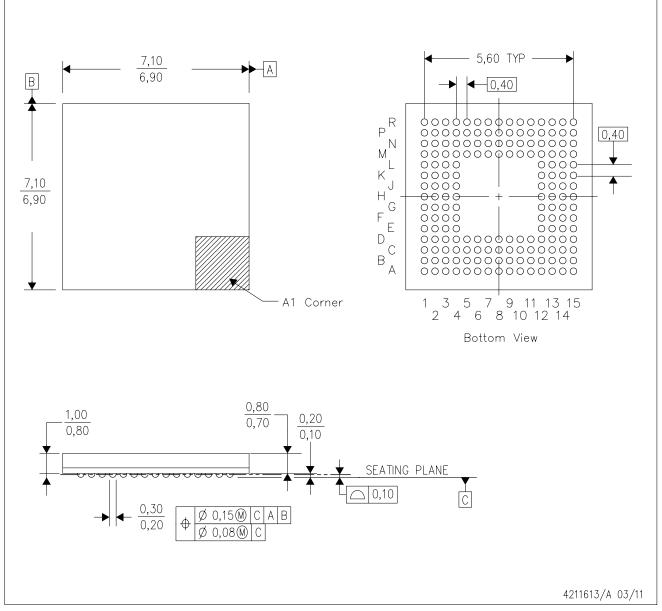

- (3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device
- (5) Multiple Device markings will be inside parentheses. Only on Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
