

#### Features

- Low Voltage and Standard Voltage Operation
  - 5.0 (Vcc = 4.5V to 5.5V)
  - 2.7 (Vcc = 2.7V to 5.5V)
  - 2.5 (Vcc = 2.5V to 5.5V)
- 3-Wire Serial Interface
- 2 MHz Clock Rate (5V) Compatibility
- Self-Timed Write Cycle (10 ms max)
  - High Reliability Endurance: 1 Million Cycles Data Retention: 100 Years
- Automotive Grade and Extended Temperature Devices Available
- 8-Pin PDIP and JEDEC SOIC Packages

#### Description

The AT93C46A provides 1024 bits of serial electrically erasable programmable read only memory (EEPROM ) organized as 64 words of 16 bits each. The device is optimized for use in many industrial and commercial applications where low power and low voltage operation are essential. The AT93C46A is available in space saving 8-pin PDIP and 8-pin JEDEC packages.

The AT93C46A is enabled through the Chip Select pin (CS), and accessed via a 3-wire serial interface consisting of Data Input (DI), Data Output (DO), and Shift Clock (SK). Upon receiving a READ instruction at DI, the address is decoded and the data is clocked out serially on the data output pin DO. The WRITE cycle is completely self-timed and no separate ERASE cycle is required before WRITE. The WRITE cycle is only enabled when the part is in the ERASE/WRITE ENABLE state. When CS is brought "high" following the initiation of a WRITE cycle, the DO pin outputs the READY/BUSY status of the part.

The AT93C46A is available in 4.5V to 5.5V, 2.7V to 5.5V, and 2.5V to 5.5V versions.

## Pin Configurations

Pin Name	Function
CS	Chip Select
SK	Serial Data Clock
DI	Serial Data Input
DO	Serial Data Output
GND	Ground
Vcc	Power Supply
NC	No Connect
DC	Don't Connect

## **Absolute Maximum Ratings\***

Operating Temperature55°C to +125°C
Storage Temperature65°C to +150°C
Voltage on Any Pin with Respect to Ground
Maximum Operating Voltage6.25V
DC Output Current 5.0 mA

\*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Instruction Set for the AT93C46A

1

-

			Address	
Instruction	SB	Op Code	x 16	Comments
READ	1	10	A5 - A0	Reads data stored in memory, at specified address.
EWEN	1	00	11XXXX	Write enable must precede all programming modes.
ERASE	1	11	A <sub>5</sub> - A <sub>0</sub>	Erase memory location An - A0.
WRITE	1	01	A5 - A0	Writes memory location An - Ao.
ERAL	1	00	10XXXX	Erases all memory locations. Valid only at $V_{CC} = 4.5V$ to 5.5V.
WRAL	1	00	01XXXX	Writes all memory locations. Valid only at Vcc = 4.5V to 5.5V.
EWDS	1	00	00XXXX	Disables all programming instructions.

## **Functional Description**

The AT93C46A is accessed via a simple and versatile three-wire serial communication interface. Device operation is controlled by seven instructions issued by the host processor. A valid instruction starts with a rising edge of CS and consists of a Start Bit (logic '1') followed by the appropriate Op Code and the desired memory Address location.

**READ (READ):** The Read (READ) instruction contains the Address code for the memory location to be read. After the instruction and address are decoded, data from the selected memory location is available at the serial output pin DO. Output data changes are synchronized with the rising edges of serial clock SK. It should be noted that a dummy bit (logic '0') precedes the 16 bit data output string.

**ERASE/WRITE (EWEN):** To assure data integrity, the part automatically goes into the Erase/Write Disable (EWDS) state when power is first applied. An Erase/Write Enable (EWEN) instruction must be executed first before any programming instructions can be carried out. Please note that once in the Erase/Write Enable state, programming remains enabled until an Erase/Write Disable (EWDS) instruction is executed or V<sub>CC</sub> power is removed from the part.

**ERASE (ERASE):** The Erase (ERASE) instruction programs all bits in the specified memory location to the logical '1' state. The self-timed erase cycle starts once the ERASE instruction and address are decoded. The DO pin outputs the READY / BUSY status of the part if CS is brought high after being kept low for a minimum of 250 ns (tcs). A logic '1' at pin DO indicates that the selected memory location has been erased, and the part is ready for another instruction. WRITE (WRITE): The Write (WRITE) instruction contains the 16 bits of data to be written into the specified memory location. The self-timed programming cycle starts after the last bit of data is received at serial data input pin DI. The DO pin outputs the READY/BUSY status of the part if CS is brought high after being kept low for a minimum of 250 ns (tcs). A logic '0' at DO indicates that programming is still in progress. A logic '1' indicates that the memory location at the specified address has been written with the data pattern contained in the instruction and the part is ready for further instructions.

**ERASE ALL (ERAL):** The Erase All (ERAL) instruction programs every bit in the memory array to the logic '1' state and is primarily used for testing purposes. The DO pin outputs the READY/BUSY status of the part if CS is brought high after being kept low for a minimum of 250 ns (tcs). The ERAL instruction is valid only at  $V_{CC} = 5.0V \pm 10\%$ .

WRITE ALL (WRAL): The Write All (WRAL) instruction programs all memory locations with the data patterns specified in the instruction. The DO pin outputs the READY/BUSY status of the part if CS is brought high after being kept low for a minimum of 250 ns (tcs). The WRAL instruction is valid only at V<sub>CC</sub> =  $5.0V \pm 10\%$ .

**ERASE/WRITE DISABLE (EWDS):** To protect against accidental data disturb, the Erase/Write Disable (EWDS) instruction disables all programming modes and should be executed after all programming operations. The operation of the READ instruction is independent of both the EWEN and EWDS instructions and can be executed at any time.
